

**What Is Claimed Is:**

1. A winding frame comprising:

a winding face having a curvature of a designated-shape at the center, being mounted with a wire position guide that is projected as much as a designated width to a vertical direction of a coil to be wound around an arbitrary portion of the internal electric field for increasing a coiling density;

a guide face for guiding an entry of the coil, being disposed at both sides of the winding face with a curved surface and an inclination of a designated shape, and being mounted with a internal guide pin for shaping a coil to be wound around the winding face; and

a base for supporting the winding face and the guide face, being fixated onto the guide face vertically.

2. The winding frame according to claim 1, wherein the wire position guide is formed at an approximately 1/2 position of a longitudinal direction of the electric field.

3. A deflection yoke, comprising:

a conical-shaped coil separator mounted with a front cover that bonds with a cathode-ray tube and a rear cover that bonds with the neck portion on the opposite side;

a ferrite core for forming a magnetic field on the

external side of the coil separator;

a deflection coil for forming a magnetic field together with the ferrite core; and

a coiling density adjustment groove for, formed to a  
5 vertical direction of the coil in order, increasing a coiling density at an arbitrary portion of an electric field of an internal side of the deflection coil.

4. The deflection yoke according to claim 3, wherein  
10 the coiling density adjustment groove is formed at an approximately 1/2 position of a longitudinal direction of the electric field.

5. The deflection yoke according to claim 3, wherein  
15 the deflection coil is a horizontal deflection coil.

6. The deflection yoke according to claim 3, wherein the deflection coil is a vertical deflection coil.
